ABSTRAT OF THE DISCLOSURE

A small memory card includes a substrate, a plurality of memory chips, a plurality of wires, and a glue layer, the substrate is formed with a plurality of through slots of the substrate, then the plurality of memory chips are mounted on the substrate, so that the plurality of bounding pads of the memory chip are exposed from through slot, the plurality of wires are electrically connected to the substrate, the glue layer is encapsulated the plurality of memory chips at the same time. Thus, the small memory card of present invention has small packed volume, and the manufacturing processes may be convenient.
